An individual digital signal then assumes one of only two possible values: low and high (say, 0 V and +1.8 V), corresponding to logic 0 and logic 1, respectively. An analog-to-digital converter (ADC) provides at its output the digits of the

Moreover, coverage in NGS could be good enough to quantify the methylation level for particular loci. The technique of serial analysis of gene expression (SAGE) has been adapted for this purpose and is known as methylation-specific digital karyotyping , as well as a similar technique, called methyl-sensitive cut
