Element Periodic Table Compounds Review

Each element is represented by a unique symbol. The notation for each element can be found on the periodic table of elements. The elements can be divided into three categories that have characteristic properties: metals, nonmetals, and semimetals. Most elements are metals, which are found on the left and toward the bottom of the periodic table.

The periodic table, also known as the periodic table of elements, arranges the chemical elements such as hydrogen, silicon, iron, and uranium according to their recurring properties. The number of each element corresponds to the number of protons in its nucleus (which is the same as the number of electrons orbiting that nucleus).

Periodic table - Wikipedia

I'm in my 60s born September 30,1951 so I remember back in the 1960s, when I went to school, there were only 103 elements in the periodic table. Now we have 118 elements. Fantastic!!! I wonder how many more new elements can be synthesized in the years to come. I'm sure that there is an upper limit.
