A transformer is an alternating flux machine while induction motor is a rotating flux machine. In a transformer, mostly a ferromagnetic iron core is used as a medium for the passage of flux from primary to secondary, whereas in an induction motor, the air gap is used between rotor and stator.

and AC induction motors. In order to understand how they work, first you need to understand the principle of induction. Induction is the process by which a magnetic field can induce current in a wire.

## **Morning Exam**

Mutual induction is the process by which a coil of wire magnetically induces a voltage into another coil located in close proximity to it. Then we can say that transformers work in the “magnetic domain”, and transformers get their name from the fact that they “transform” one voltage or current level

6 CHAPTER Lifetime Reduction of Transformers and Induction Machines  
The total installed power capacity within the Eastern, Western, and Texan power pools of the United States is 900 GW with about 70 GW of spinning reserve. Approximately 60% of the 900 GW is consumed by induction motors and 100% passes through transformers.
