## Diesel Engine Testing Parameters

Diesel engine oil is the lubricant vital for the engine's lubrication system. It is feed to the pump from the sump then through a strainer. It is then pulled through the oil filter and goes through the main bearing and oil pressure gauge before it passes the rotating crankshaft and onto the connecting rod.

Qianfan Xin, in Diesel Engine System Design, 2013. 3.3.2 Engine calibration with RSM. Engine performance and emissions calibration is probably the area where the RSM DoE technique has been most widely used compared with other engine application areas. Engine calibration refers to tuning mechanically or electronically the adjustable parameters on the engine to reach desirable performance.

With a scan tool, compare available pressure parameters with the key on, engine off. If the exhaust pressure sensor is skewed, replace it and retest. If the sensor reads within .5 PSI of the others, check the tube, passages, and sensor for carbon build up or restriction.

Turbocharger lag (turbo lag) is the time required to change power output in response to a throttle change, noticed as a hesitation or slowed throttle response when accelerating as compared to a naturally aspirated engine. This is due to the time needed for the exhaust system and turbocharger to generate the required boost which can also be referred to as spooling.
